

Random curve

100

The graph shows a function $f(x)$ on a coordinate plane. The function is composed of two parts: a red segment and a black segment. The red segment is a curve that starts at the origin $(0,0)$, increases to a local maximum, and then decreases to a local minimum. The black segment is a curve that starts at the local minimum of the red segment, increases to a local maximum, and then decreases. The two segments meet at a point where the function is continuous but has a sharp corner, indicating a change in the derivative.
